2. Requirement Analysis Phase

The Requirement Analysis Phase focused on identifying the functional requirements needed to improve the accuracy and consistency of Incident records in ServiceNow. The requirements were derived from the problems identified during the brainstorming phase.

The primary requirement is to apply additional controls when an Incident has a **High Impact**. When the Impact field is set to High, the system should automatically perform specific actions to ensure that the Incident contains the necessary information before it is submitted.

The **Urgency** field should be automatically set to High when the Impact is High. At the same time, the Urgency field should become read-only so that users cannot manually change the value while the High Impact condition is active.

Another important requirement is the validation of the **Assigned To** field. If an Incident has High Impact and the Assigned To field is empty, the system should prevent the user from saving the Incident and display an appropriate validation message.

The project also requires control over the **State** field. Users should not be allowed to change the State directly through list editing. However, they should be able to update the State through the normal Incident form.

The system should also restore the normal field behavior when the Impact is changed from High to another value. This ensures that the controls are applied only when the defined condition is satisfied.

Functional Requirements

- The system shall identify when **Impact = High**.
- The system shall automatically set **Urgency to High**.
- The system shall make **Urgency read-only** for High Impact Incidents.
- The system shall require **Assigned To** for High Impact Incidents.
- The system shall prevent saving when Assigned To is empty.
- The system shall prevent **State** changes through list editing.
- The system shall allow State changes through the Incident form.
- The system shall reverse the applicable controls when Impact is no longer High.

These requirements provide the foundation for designing and developing the UI Policies and Client Scripts used in the project.

Expected Outcome

The requirement analysis establishes a clear set of business rules that the ServiceNow Incident form must follow. These requirements will be used in the next phases to design and implement the solution.
