3. Project Design Phase

The Project Design Phase defines how the identified requirements will be implemented in the ServiceNow Incident module. The solution is designed using **UI Policies, UI Policy Actions, and Client Scripts** to control the behavior of Incident form fields and enforce the required business rules.

The main design is based on the **Impact** field. When the Impact of an Incident is set to **1 – High**, the system should apply additional controls to ensure that the Incident contains complete and valid information.

A UI Policy named **High Impact Control** is designed for the Incident table. The condition of the policy is configured as **Impact is 1 – High**. The policy is also configured with **Reverse if false** so that the applied field behavior returns to normal when the condition is no longer satisfied.

A UI Policy Action is designed for the **Urgency** field. When the High Impact condition is satisfied, the Urgency field is made **read-only**. This prevents users from manually changing the value while the Incident requires High Urgency.

The project also includes three Client Scripts for different types of user interactions:

- **onChange Client Script:** Runs when the Impact field changes and automatically sets Urgency to High when Impact is High.
- **onSubmit Client Script:** Validates the Assigned To field before saving and prevents submission when it is empty for a High Impact Incident.
- **onCellEdit Client Script:** Prevents users from changing the State field directly through list editing.

The overall design ensures that each requirement is handled by the appropriate ServiceNow client-side feature. UI Policies are used for dynamic field behavior, while Client Scripts are used for automation and validation.

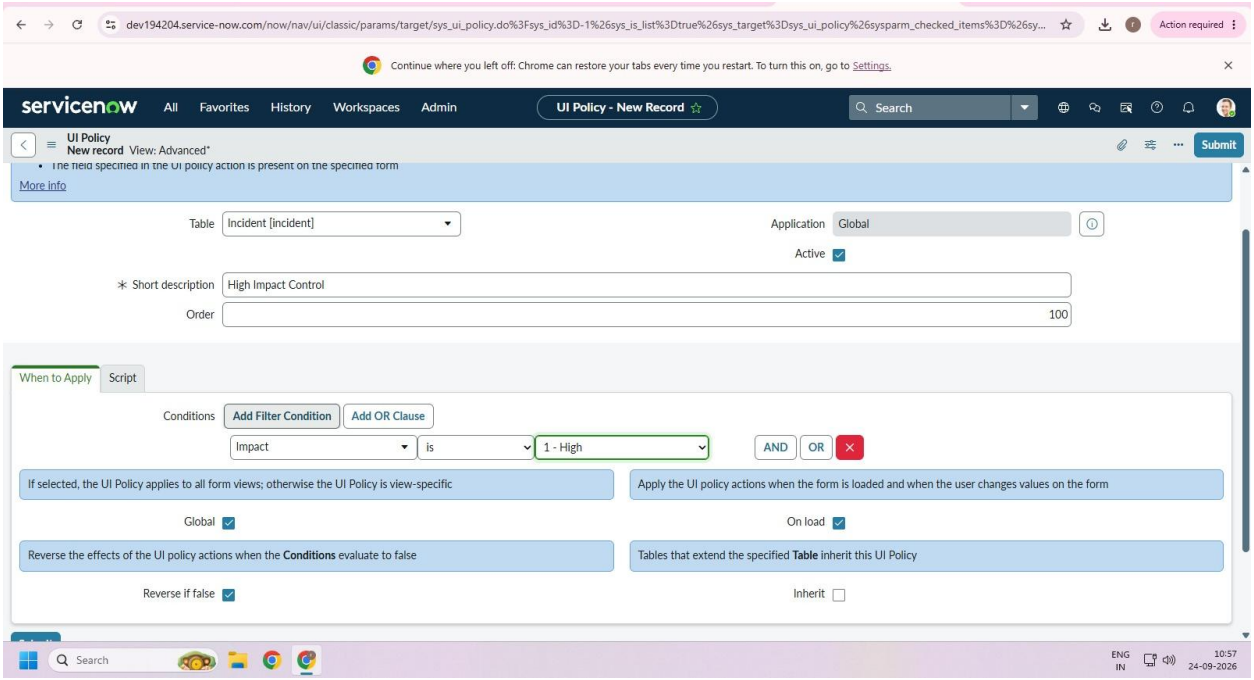

Design Components

Component	Purpose
High Impact Control UI Policy	Applies controls when Impact is High
Urgency UI Policy Action	Makes Urgency read-only
onChange Client Script	Automatically sets Urgency to High
onSubmit Client Script	Validates Assigned To before saving
onCellEdit Client Script	Prevents State changes through list editing

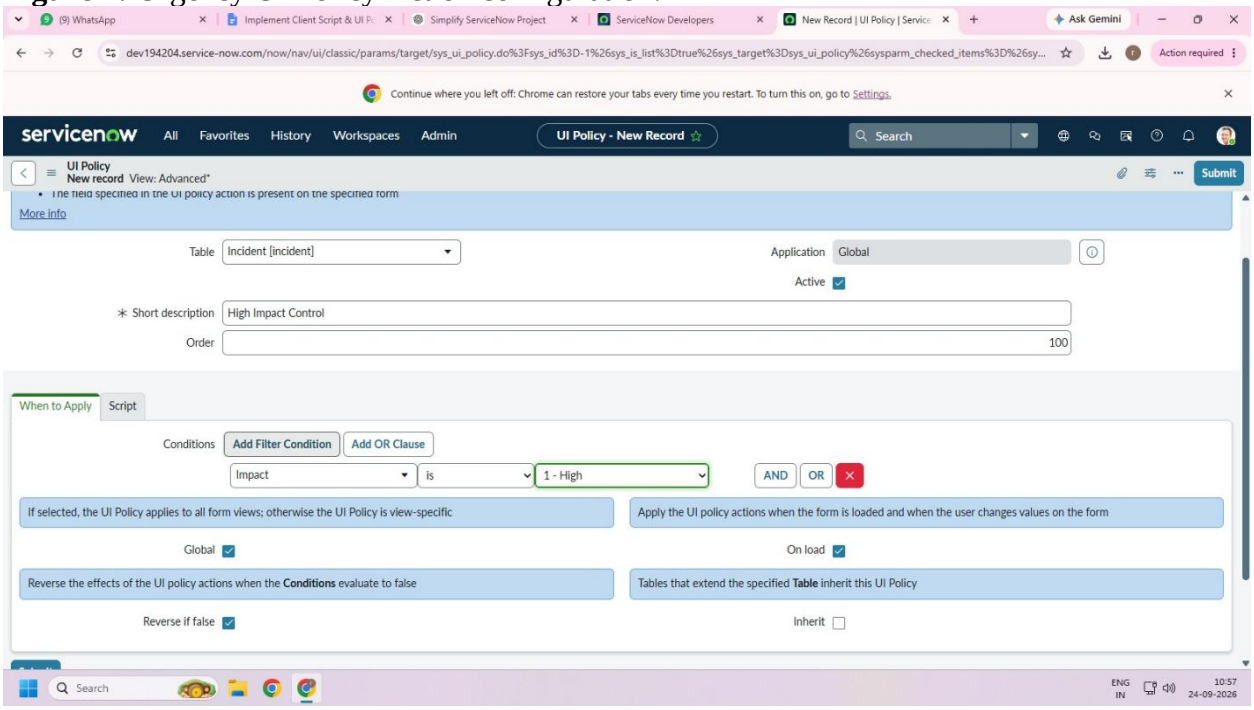

Suggested Screenshots

For this phase, you can add **2–3 screenshots**:

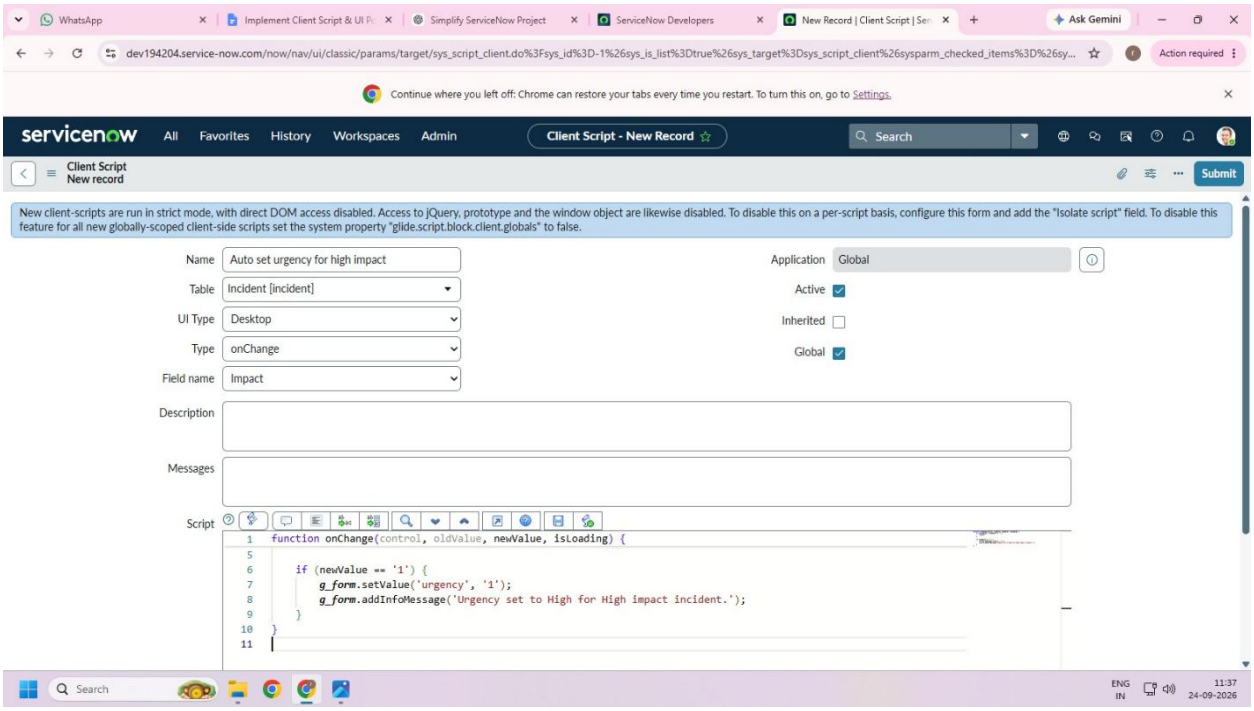

- **Figure 1:** High Impact Control UI Policy configuration.

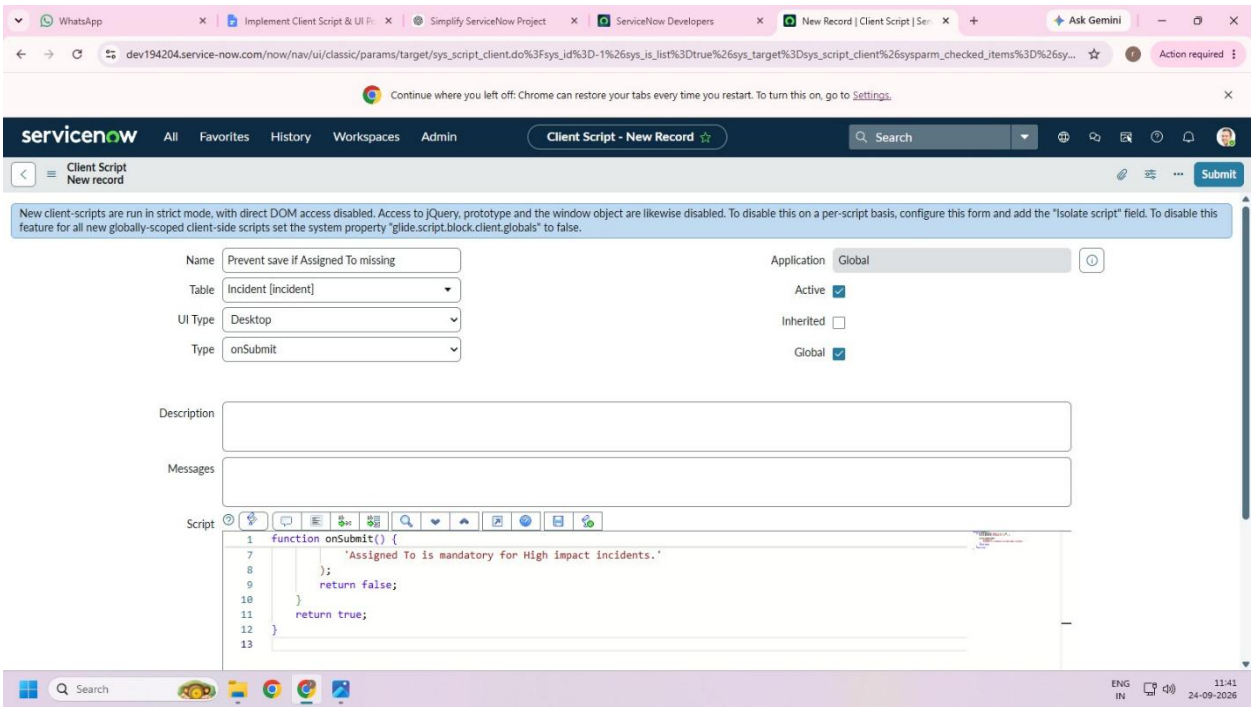

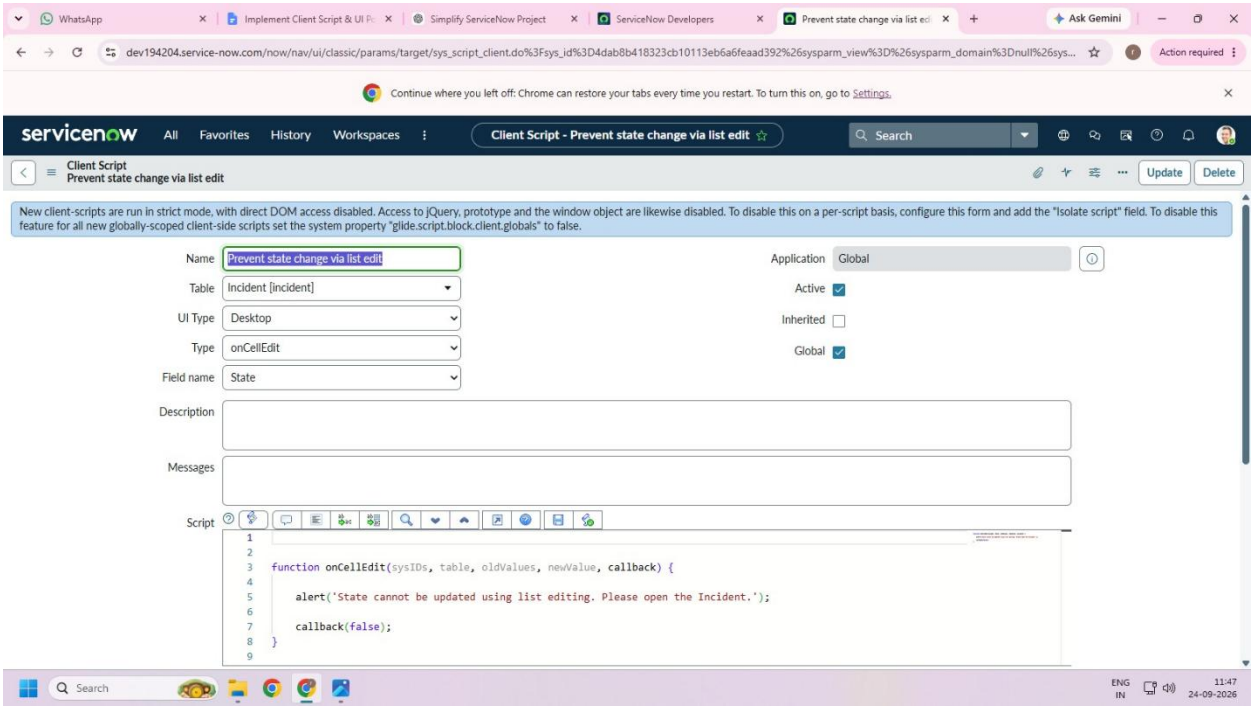

- **Figure 2:** Urgency UI Policy Action configuration.

- **Figure 3:** Overall Client Script design/configuration, if available.

New client-scripts are run in strict mode, with direct DOM access disabled. Access to jQuery, prototype and the window object are likewise disabled. To disable this on a per-script basis, configure this form and add the "Isolate script" field. To disable this feature for all new globally-scoped client-side scripts set the system property "glide.script.block.client.globals" to false.

Phase Outcome:

The Project Design Phase establishes the technical structure of the solution and defines how UI Policies and Client Scripts will work together to enforce the required Incident management rules.
