5. Project Development Phase

The Project Development Phase focuses on implementing the planned design in the ServiceNow Incident module. During this phase, the UI Policy, UI Policy Action, and Client Scripts are created and configured according to the identified requirements.

First, the **High Impact Control** UI Policy is created on the Incident table. The condition is configured as **Impact is 1 – High**. When this condition is satisfied, the defined field controls are

applied. The **Reverse if false** option is enabled so that the field behavior returns to normal when the Impact value changes.

Next, a UI Policy Action is created for the **Urgency** field. The field is configured as read-only when the Incident has High Impact. This prevents users from manually changing the Urgency value under the defined condition.

An **onChange Client Script** is then created for the Impact field. When the Impact value changes to High, the script automatically sets the Urgency field to High and displays an informational message to the user.

The next step is to create an **onSubmit Client Script** for validating the Assigned To field. When a High Impact Incident is submitted, the script checks whether the Assigned To field contains a value. If it is empty, the system displays an error message and prevents the Incident from being saved.

Finally, an **onCellEdit Client Script** is created for the State field. This script prevents users from changing the State directly from the Incident list. Users are instructed to open the Incident record and make the required change through the normal form.

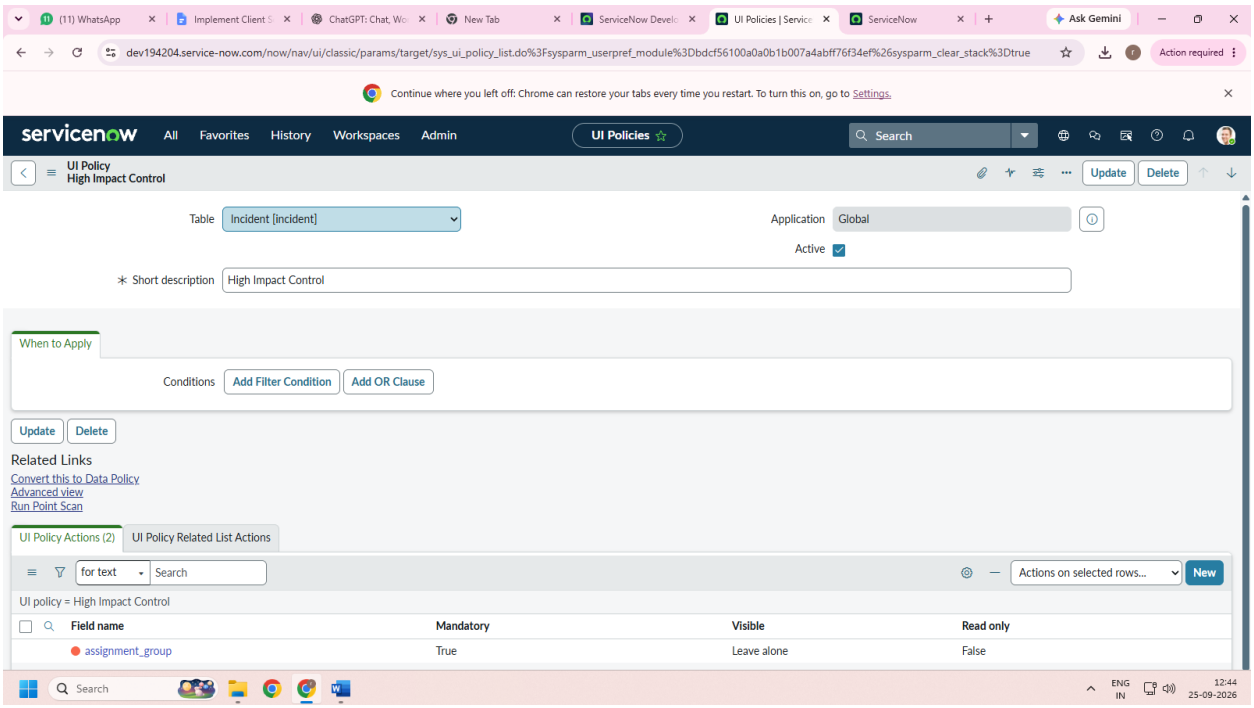

Development Components

- **UI Policy:** High Impact Control
- **UI Policy Action:** Urgency – Read-only
- **onChange Client Script:** Auto set urgency for high impact
- **onSubmit Client Script:** Prevent save if Assigned To is missing
- **onCellEdit Client Script:** Prevent state change via list edit

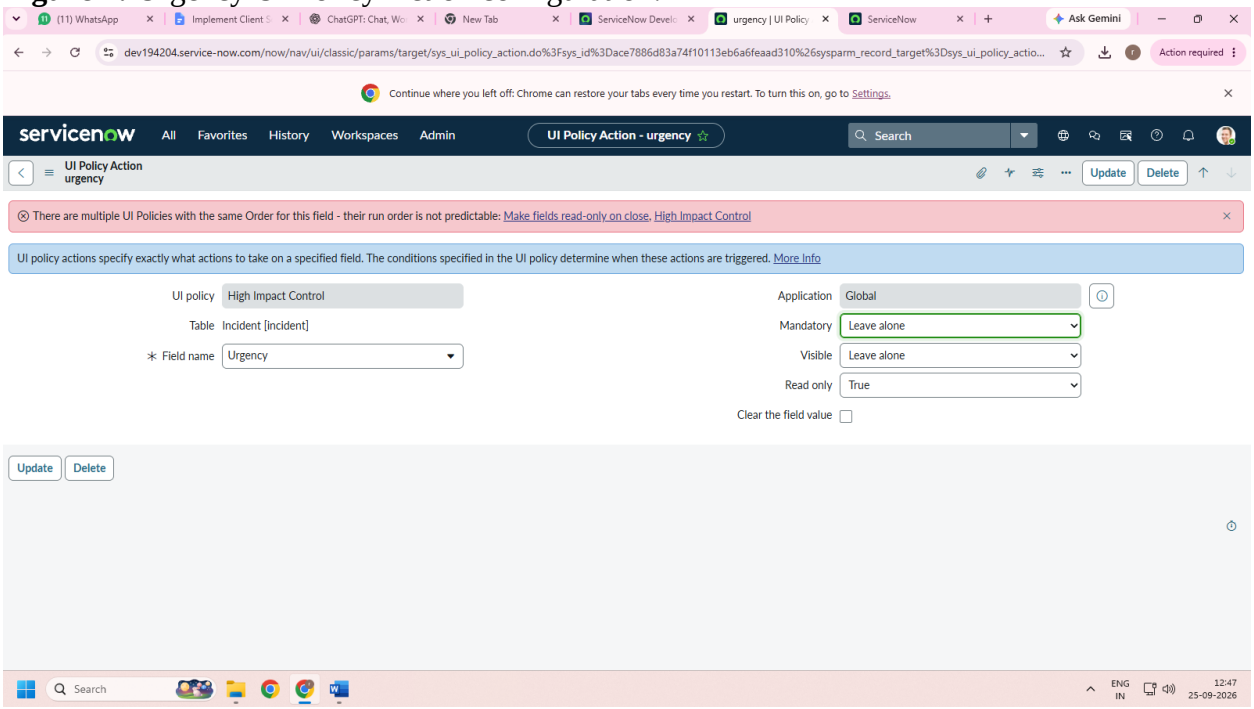

Suggested Screenshots

You can add the following screenshots in this phase:

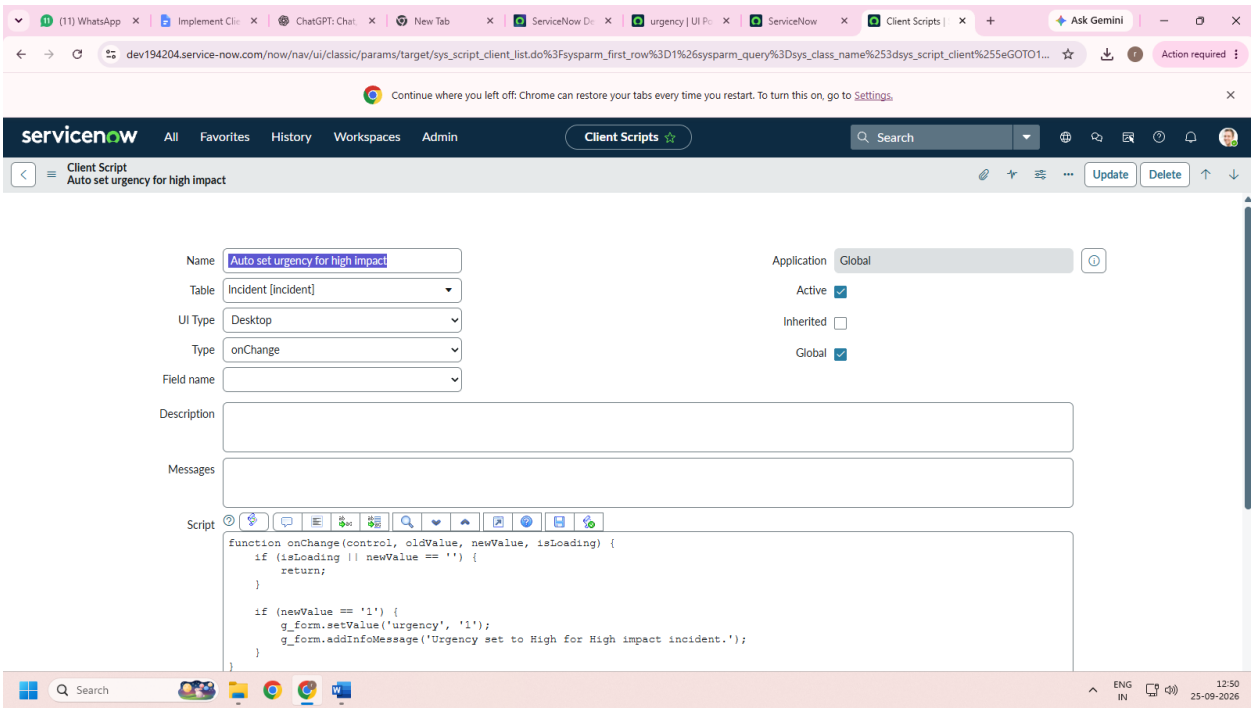

- **Figure 1:** High Impact Control UI Policy configuration.

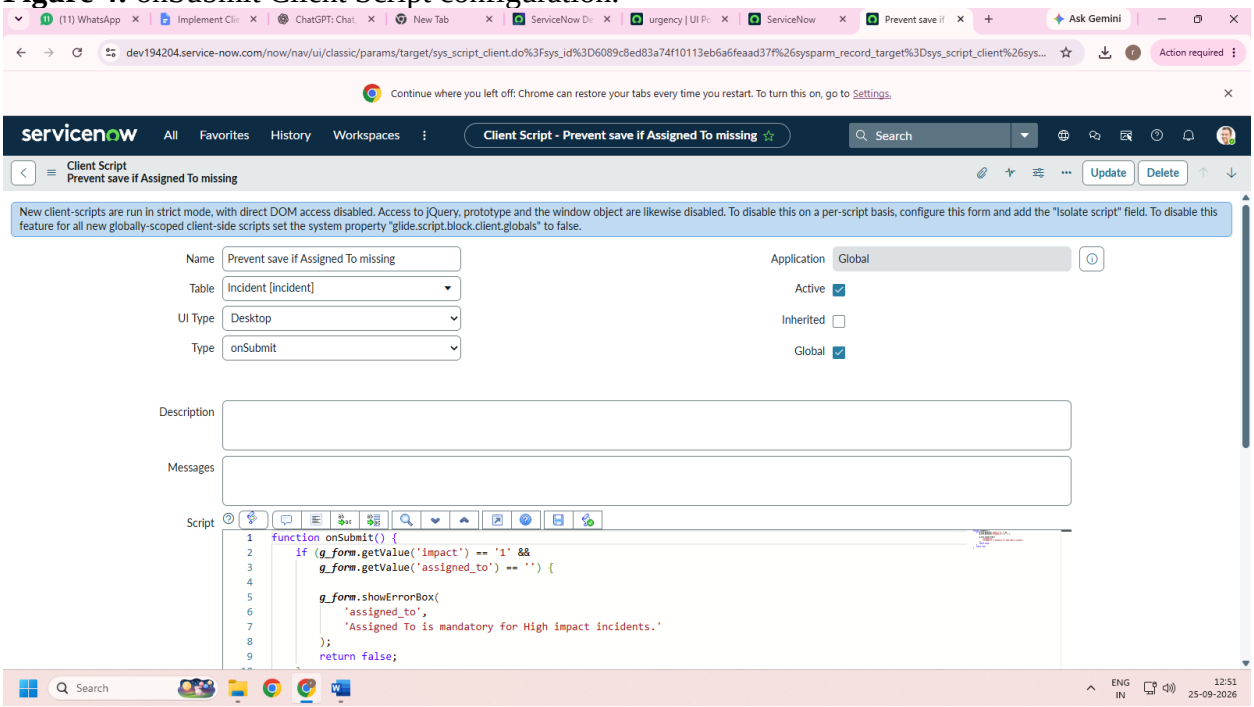

- **Figure 2:** Urgency UI Policy Action configuration.

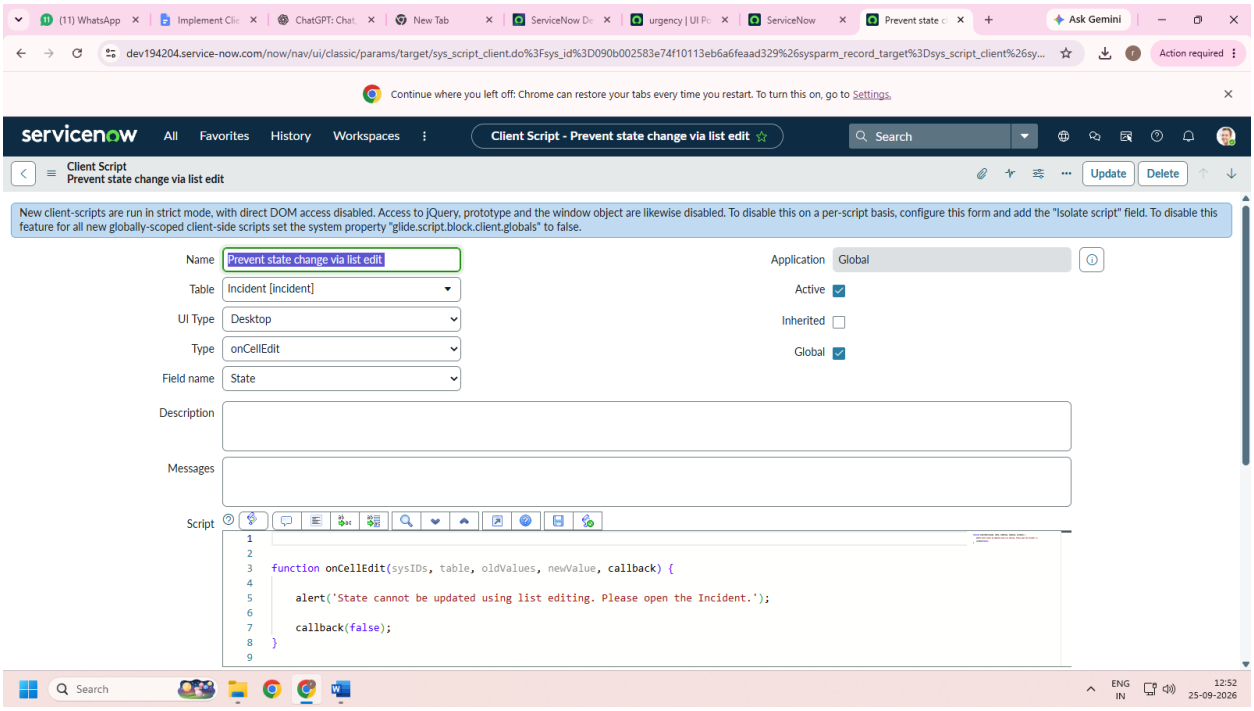

- **Figure 3:** onChange Client Script configuration.

- **Figure 4:** onSubmit Client Script configuration.

- **Figure 5:** onCellEdit Client Script configuration.

- 

These screenshots provide evidence that the planned configuration was successfully developed and implemented in ServiceNow.

Phase Outcome

The development phase results in a fully configured Incident form where field behavior, automatic updates, validation, and list-edit restrictions are controlled using ServiceNow UI Policies and Client Scripts.
