6. Project Testing Phase

The Project Testing Phase was carried out to verify whether the implemented UI Policies and Client Scripts were functioning according to the defined requirements. Different Incident scenarios were tested to validate field behavior, automatic updates, form validation, and list-edit restrictions.

First, a new Incident was created and the **Impact** field was set to High. The system was checked to confirm that the configured High Impact controls were triggered correctly. The **Urgency** field was automatically set to High and became read-only.

Next, the **Assigned To** field was left empty and an attempt was made to submit the Incident. The onSubmit Client Script detected the missing value, displayed an error message, and prevented the record from being saved.

The successful save scenario was then tested by selecting a valid user in the Assigned To field. The Incident was submitted successfully, confirming that the validation works correctly when the required information is provided.

The **Reverse if false** behavior was also tested by changing the Impact from High to Medium. The applicable UI Policy behavior was reversed, and the Urgency field became editable again.

The State field was tested from the Incident list by attempting to edit it directly. The onCellEdit Client Script displayed an alert and blocked the change. Finally, State was changed through the normal Incident form, and the update was successfully saved.

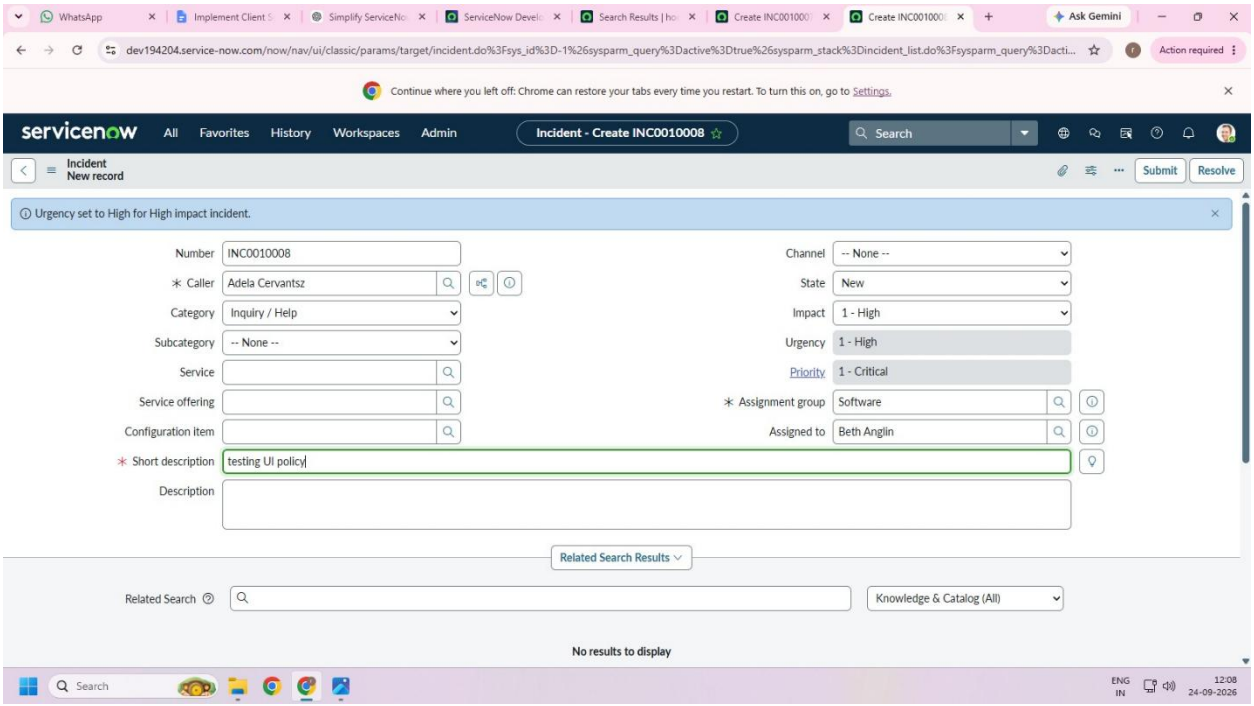

Test Scenarios

Test Scenario	Expected Result
Impact set to High	High Impact controls are triggered
High Impact + empty Assigned To	Record should not save
High Impact + Assigned To filled	Record should save successfully
Impact changed to Medium	Applicable controls should be reversed
State edited from list	Change should be blocked
State edited from form	Change should be allowed

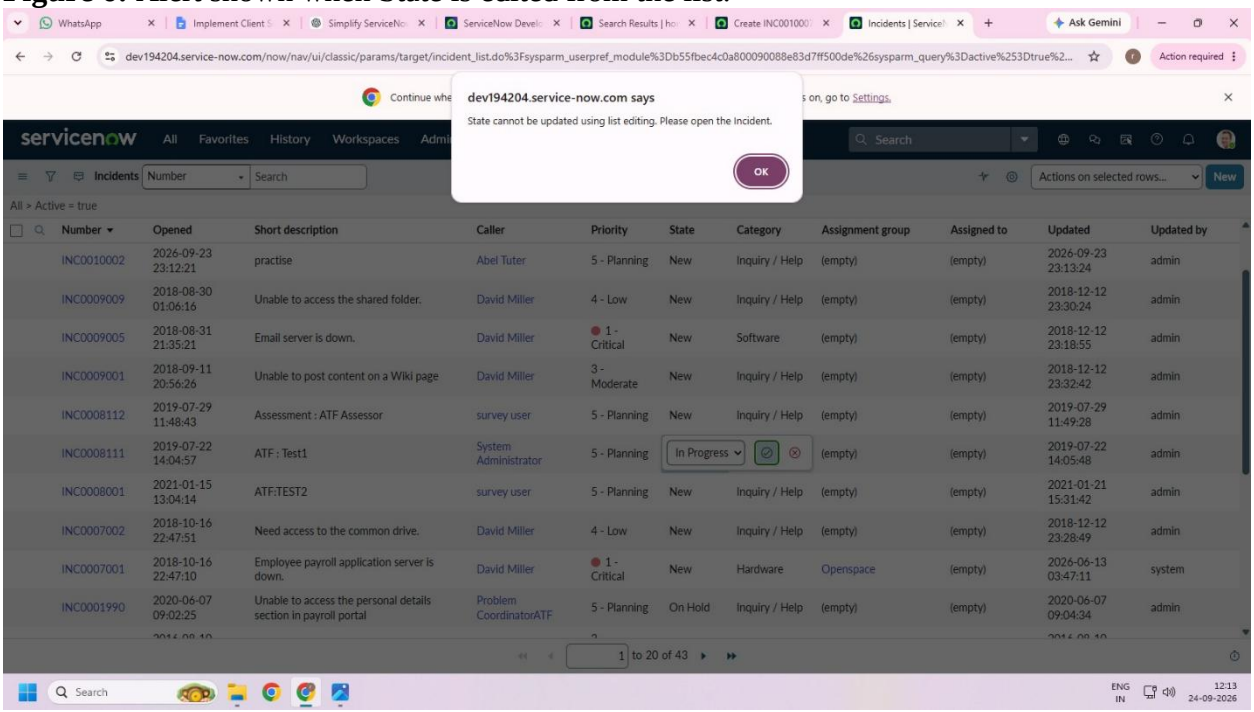

Suggested Screenshots

Add screenshots for the actual testing results:

- **Figure 1:** Impact set to High with Urgency automatically updated.
- **Figure 2:** Urgency field shown as read-only.
- **Figure 3:** Error message when Assigned To is empty.

- **Figure 4:** Successful Incident save after assigning a user.
- **Figure 5:** Urgency becoming editable after Impact changes to Medium.
- **Figure 6:** Alert shown when State is edited from the list.

- **Figure 7:** Successful State update through the Incident form.

Phase Outcome

The testing confirmed that the implemented UI Policies and Client Scripts perform the required functions. The system successfully validates Incident data, automatically updates field values, controls field behavior, and restricts unauthorized list-based changes.
