8. Project Demonstration Phase

The Project Demonstration Phase presents the completed **Implement Client Script & UI Policy (Incident)** project and demonstrates how the implemented features work in the ServiceNow Incident module.

The demonstration begins by opening an Incident record and setting the **Impact** field to High. Once the condition is satisfied, the configured UI Policy is triggered. The Urgency field is automatically set to High through the onChange Client Script and becomes read-only through the UI Policy Action.

Next, the **Assigned To** field is left empty and the user attempts to save the Incident. The onSubmit Client Script identifies the missing value, displays an error message, and prevents the Incident from being saved.

The demonstration then shows the successful scenario by selecting a user in the Assigned To field and submitting the Incident. The record is saved successfully because all required conditions have been satisfied.

The reverse condition is also demonstrated by changing the Impact from High to Medium. The applicable UI Policy behavior is reversed, allowing the Urgency field to return to its normal editable state.

Finally, the Incident list is opened to demonstrate the **onCellEdit Client Script**. An attempt is made to change the State directly from the list, and the system blocks the change. The State is then updated through the normal Incident form to demonstrate that form-based updates are allowed.

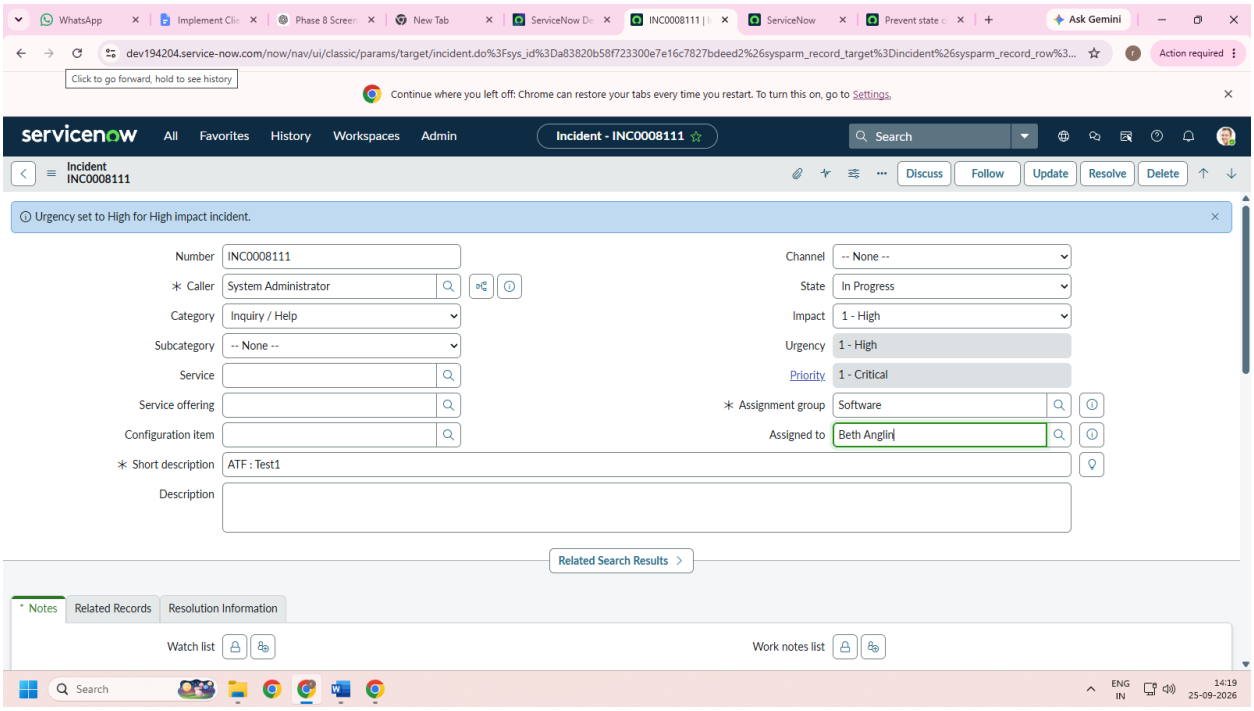

Demonstration Flow

1. Open an Incident record.
2. Set **Impact = High**.
3. Verify that **Urgency is automatically set to High**.
4. Verify that **Urgency becomes read-only**.
5. Leave **Assigned To** empty and attempt to save.
6. Verify the validation error.
7. Select an Assigned To user and save successfully.
8. Change Impact from High to Medium.
9. Verify that the field behavior is reversed.
10. Attempt to edit State from the Incident list.
11. Verify that the list edit is blocked.
12. Change State through the Incident form and verify successful saving.

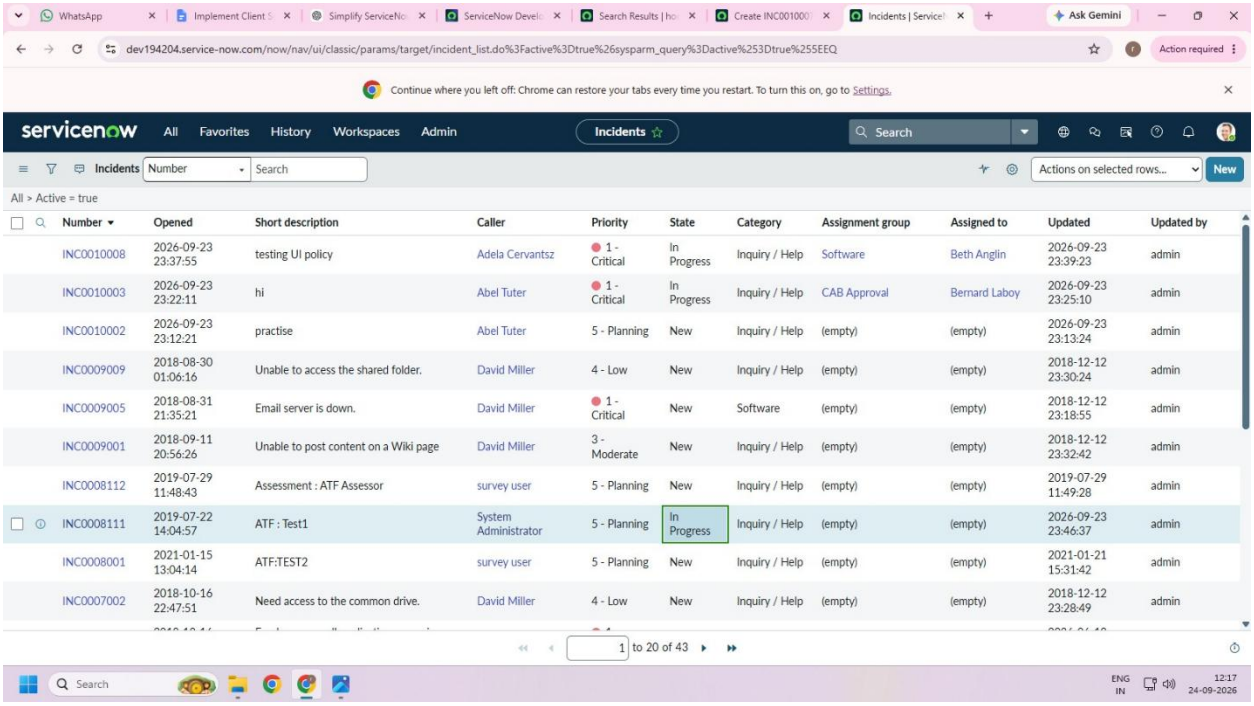

Suggested Screenshots

For the final demonstration, include the most important screenshots:

Phase Outcome

The final demonstration shows that the project successfully implements client-side controls for Incident records. The UI Policy and Client Scripts work together to provide automatic field updates, validation, field restrictions, and controlled user interactions, thereby improving the consistency and accuracy of Incident data.
